### Technical Assistance

All tech personnel are expertly qualified to answer any technical questions.  
Technicians are available Monday through Friday from 9:00 a.m. until 8:00 p.m. and Saturday 10:00 a.m. until 4:00 p.m.

### Address

288 Canton Avenue • Wintersville, Ohio 43953

### Telephone

Phone: 740-264-4710 • 800-878-8007 • Fax: 740-264-7306

# TECHNICAL ASSISTANCE

---

Should you need help. First check our website at [www.bulldogsecurity.com/wires.htm](http://www.bulldogsecurity.com/wires.htm) or call our toll-free Tech Support Hotline Monday through Friday 9AM-8PM and Saturday 10AM-4PM EST at 800-878-8007.

You must give the following information:

- Name
- Telephone Number with Area Code (Fax number if applicable)
- Year, Make, and Model of the vehicle
- The model number of the system you are installing
- The type of assistance you are requesting

If you give the above information you will be called back as soon as possible, usually within 10 minutes.

## PASSLOCK HISTORY

---

The Bulldog Model 721 interface module is used when installing remote start products in GM vehicles equipped with the PASSKEY, PASSLOCK I and PASSLOCK II anti-theft system. This model allows easy interfacing while maintaining the OEM system's integrity. The Model 721, when installing with the passlock I system will provide a ground to the "bulb check" wire, immediately after the vehicle starts, it will provide the proper resistor code (R-Code) to the instrument panel cluster (IPC). The Model 721 has no effect on the Passkey or Passlock system when the remote start is not in use. The factory Passlock anti-theft system remains fully functional.

The GM Passlock system is a key-based, fuel shutdown, anti-theft system. The system requires that the key cylinder be mechanically turned using a key. When the key cylinder is properly turned, it generates the R-Code, which is sent to the IPC. The IPC, which houses the Passlock decoder, then interprets the signal. Unlike the Passkey system, Passlock must see the correct resistance code at the correct time. When the ignition switch is turned to the CRANK position, the "bulb check" wire is switched to ground. This starts a time window during which the IPC analyzes the R-Code. If the R-Code is valid and received in the proper window of time, the IPC sends a code via data bus to the power train control module (PCM) to enable the fuel system. The vehicle will then start and stay running. If the R-Code is incorrect, the vehicle will start and run for a moment and then shut off.

## PASSKEY INSTALLATION

---

**NOTE:** Never connect the wiring on the Passkey or Passlock system without first setting the dipswitch positions. Installing the unit with all dipswitches in the down or (0) position could cause damage in your vehicle and/or Passkey or Passlock system.

1. Locate the 2 wire harness in the steering column coming from the ignition switch cylinder. This harness should contain 2 **WHITE** wires or 1 **WHITE** or 1 **PURPLE** wire.
2. To measure resistance on the passkey pillet on the key, see figure 1.
3. Cut the **WHITE** or **PURPLE** wire in half.
4. Strip back the other **WHITE** or **PURPLE** wire to expose the copper for a connection.
5. Look up the value read from the meter on the chart and set the switches remembering a (1) on the chart indicates a switch in the "up" position.
6. Attach the **GREEN** wire to the key cylinder end of the cut **WHITE** or purple wire.
7. Attach the **YELLOW** wire to the remaining end of the cut **WHITE** or **PURPLE** wire.
8. Attach the **BLUE** wire to the stripped back **WHITE** or **PURPLE** wire.
9. Attach the **RED** wire to a fused constant 12V wire fused at 10 Amps.
10. The **ORANGE** wire and **PURPLE** wire are not used.
11. Connect the **WHITE** wire to the (-) **WHITE** 16awg on the remote starters relay pack.
12. Set switch 11 to the "on" or "down" position and 12 to the "off" or "up" position.

For testing resistor value on Passkey systems, see figure 1.

# PASSLOCK I INSTALLATION

**NOTE:** Never connect the wiring on the Passkey or Passlock system without first setting the dipswitch positions. Installing the unit with all dipswitches in the down or (0) position could cause damage in your vehicle and/or Passkey or Passlock system.

1. Locate the 3 wire harness in the steering column coming from the Passlock key cylinder. This harness should contain a **YELLOW**, **BLACK** and **WHITE** wire or **WHITE WITH BLACK STRIPE** wire, **BLACK** and **BLACK**.
2. Cut the **YELLOW** or **BLACK** wire.
3. With the key in the "on" position, use an ohm meter to measure the resistance from the key cylinder side of the **YELLOW** wire to the **BLACK** wire. After the measurement is made, turn the key to the "off" position.
4. Look up the value read from the meter on the chart and set the switches remembering a (1) on the chart indicates a switch in the "up" position.
5. Attach the **GREEN** wire to the key cylinder end of the cut **YELLOW** or **BLACK** wire.
6. Attach the **YELLOW** wire to the remaining end of the cut **YELLOW** or **BLACK** wire.
7. Attach the **BLUE** wire to the **BLACK** or (BLK)0 wire in the 3 wire harness.
8. Attach the **RED** wire to a fused constant +12V wire.
9. Attach the **VIOLET** wire to the bulb check wire. 22 ga. wire cavity "D" or "E", wire shows ground when cranking.

TO HAVE THE RESISTANCE PRESENT BEFORE AND AFTER CRANKING, DO STEPS 10-12.

10. Attach the **WHITE** wire to the ignition wire on the remote starter. (negative out only) (**WHITE WITH BLACK STRIPE** 16 ga. wire on the relay harness)
11. Attach the **ORANGE** wire to the starter wire on the remote starter. (negative out only) (**YELLOW WITH BLACK STRIPE** 16 ga. wire on the relay harness)
12. Set switch 12 to the "on" or "down" position and 11 to the "off" or "up" position.

For testing resistor value, see figure 2a.

# PASSLOCK II INSTALLATION

**NOTE:** Never connect the wiring on the Passkey or Passlock system without first setting the dipswitch positions. Installing the unit with all dipswitches in the down or (0) position could cause damage in your vehicle and/or Passkey or Passlock system.

1. Locate the 3 18 ga. wires in the steering column coming from the ignition switch cylinder. This harness should contain a **RED WITH WHITE STRIPE** wire, **ORANGE WITH BLACK STRIPE** wire and **YELLOW** wire.
2. Cut the **YELLOW** wire in half.
3. With the key in the "cranking" position, use an ohm meter to measure the resistance from the key cylinder side of the **YELLOW** wire to a stripped back portion of the **ORANGE WITH BLACK STRIPE** wire. Do this several times, making sure you have the correct resistance value.
4. Look up the value read from the meter on the chart and set the switches remembering a (1) on the chart indicates a switch in the "up" position.
5. Attach the **GREEN** wire to the key cylinder end of the cut **YELLOW**.
6. Attach the **YELLOW** wire to the remaining end of the cut **YELLOW** wire.
7. Attach the **BLUE** wire to the **ORANGE WITH BLACK STRIPE** wire, simply tie in.
8. Attach the **RED** wire to a fused constant +12V wire fused at 10 awg.
9. The **ORANGE** wire and the **PURPLE** wire are not used.
10. Connect the **WHITE** wire to the (-) **WHITE** 16 awg on the remote starters relay pack.
11. Set switch 11 to the "on" or "down" position and 12 to the "off" or "up" position.

For testing resistor value, see figure 2b.

**FIGURE 1**  
Testing for Resistor Value,  
Passkey

**NOTE:** Test probes should be placed on each side of the pill embedded in the key to read the resistance.

**FIGURE 2a**  
Testing for Resistor Value, Passlock I

**FIGURE 2b**  
Testing for Resistor Value, Passlock II

## MAKING CONNECTIONS

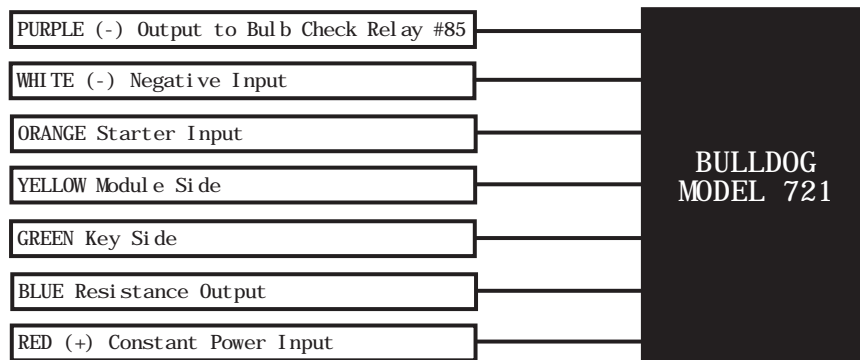

### TWO-WIRE PASSKEY SYSTEM

### THREE-WIRE PASSLOCK I AND PASSLOCK II SYSTEMS

## WIRING DIAGRAM

### WIRE CONNECTION GUIDE FOR PASSKEY

- RED (+)** • Constant Power Input: Connect to a fused source of constant 12V.
- WHITE (-)** • Negative Input: Connect to a wire from the remote start system which provides (-) ground during ignition. (**WHITE** wire 16 awg on relay harness)
- BLUE** • Resistor Relay Output #87: This wire will apply the selected resistor value to the Passkey system. Connect this wire to (small **WHITE** or **PURPLE** 20 awg) wire in the vehicle.
- GREEN** • Resistor Relay, normally closed #87a: Connect to the ignition switch side of the (small **WHITE** or **PURPLE** 20 awg) wire in the vehicle.
- YELLOW** • Resistor Relay, common #30: Connect to the small (**WHITE** or **PURPLE** 20 awg) wire facing away from the ignition switch in the vehicle. The **ORANGE** and **PURPLE** wires are not used.

### WIRE CONNECTION GUIDE FOR PASSLOCK I

- RED (+)** • Constant Power Input: Connect to a fused source of constant 12V.
- ORANGE (-)** Connect to a wire on your remote start system that supplies a (-) ground only when cranking (Bulldog 16 awg **YELLOW WITH BLACK STRIPE** wire on relay harness) wire from the remote start system which provides (-) ground only while the vehicle is cranking.
- PURPLE (-)** • Output to Bulb Check Wire: Connect to the 20 ga. **BLACK** "bulb check" wire in the ignition switch power harness. This wire will test (-) ground when the ignition switch is turned to the "start" position.

- WHITE (-)** • Negative Input: Connect to a wire from the remote start system which provides (-) ground before and after the vehicle starts, but not during cranking. (**WHITE WITH BLACK STRIPE** 16 awg wire on a relay harness)
- BLUE** • Resistor Relay Output #87: This wire will apply the selected resistor value to the Passlock system. Connect this wire to the small **BLACK** wire in the 3 wire ribbon cable in the vehicle.
- GREEN** • Resistor Relay, normally closed #87a: Connect to the ignition switch side of the **YELLOW** or **BLACK** wire in the 3 wire ribbon cable in the vehicle.
- YELLOW** • Resistor Relay, common #30: Connect to the side of the **YELLOW** or **BLACK** wire facing away from the ignition switch. This wire is located in the vehicle's 3 wire ribbon cable.

#### WIRE CONNECTION GUIDE FOR PASSLOCK II

- RED (+)** • Constant Power Input: Connect to a fused source of constant 12V.
- BLUE** • Resistor Relay Output #87: This wire will apply the selected resistor value to the Passlock system. Connect this wire to the (small **BLACK** or **BLACK WITH ORANGE STRIPE**) wire in the vehicle.
- GREEN** • Resistor Relay, normally closed #87a Connect to the ignition switch side of the **YELLOW** or **BLACK** wire in the vehicle.
- YELLOW** • Resistor Relay, common #30 Connect to the **YELLOW** or **BLACK** wire facing away from the ignition switch in the vehicle.
- WHITE (-)** • Negative Output: Connect to a wire from the remote start system which provides (-) ground during ignition (**WHITE** wire 16 awg on relay harness) The **ORANGE** and **PURPLE** wires are not used.

## SETTING DIP SWITCHES

---

**NOTE: Switches must be set before installation;**

**CAUTION: Never set switches 1-10 all to (0) "down" when installed.**

Switches 1-10 control the resistor value as shown in the chart. A "1" in the chart indicates the switch is in the "up" position. Switches 11 and 12 control the timing of the "bulb check". The "bulb check" is necessary for the car's computer start sequence. The setting of switch 11 or 12 depends on the wiring of the start wire and is described below.

The model has 10 dip switches that are used to select the proper resistor value. Find the desired resistance value on chart from dip switch settings 9 and 10. Read across the row to determine the settings for switches 1-8. Setting for switches 9 and 10 are shown at the top of the column with the desired resistance. Although the highest quality resistors have been used, some variance is possible. If the selected resistor value does not work in the vehicle, try the next higher or lower setting. If that still does not work, re-measure the resistor value. **NOTE: The system may lock up if the wrong resistor value is used. In that case, the vehicle will not start, even if the key is used. See Troubleshooting for details.**

## TROUBLESHOOTING

---

If the vehicle starts and then stalls out immediately:

1. Turn the key to the "run" position.
2. Is the "Theft System" light flashing or on solid?
  - If on solid, go to step 3
  - If flashing, go to step 4
3. Make sure the engine will start using the key. If it does, check:
  - A. Make sure that the purple wire is properly connected to the "bulb check" wire.
  - B. Make sure that the orange wire is properly connected to the yellow/black on the relay pack.
  - C. make sure that the second ignition is powered.
  - D. Make sure that the green and the yellow wires are not reversed.
  - E. The "Theft System" light stops flashing and comes on solid (about 10 minutes).
  - F. One or more of the ribbon cable wires are not disconnected.
4. Turn the key to the "run" position until the "Theft System" light stops flashing and comes on solid (about 10 minutes). Re-test the R-Code to make sure you have properly measured it. Double check the resistor setting you are using. It must be within 10% of the measured value. Correct if necessary.
5. Try to start the motor using the remote start.
